

IDEA

Idea is to make a platform to help small businesses by automating their machines so they can see and analyse their business from anywhere. Like a shopkeeper needs to maintain the record of everything which is kept on his weighing scale we can automate it by using a Arduino and image recognition techniques to capture its data automatically and send it to the mobile app so that the business man can have a clean and accurate record of its items. And many more ideas like these for small business can be made by our startup.
